

Keep your family safe

With the highly contagious Delta variant of COVID-19 spreading rapidly, **getting vaccinated is a safer choice for families.**

Common side effects of COVID-19 vaccines

You might feel tired, have a headache, or get a mild fever for one or two days. Most people only have a sore arm where they got the vaccine shot.

The good news: medical experts say that these temporary side effects are normal signs that your body is working hard to build protection against COVID-19.

Think about it

Would you rather have temporary and mild side effects
OR
suffer from COVID-19's long-term and severe symptoms?

What you need to know about COVID-19 vaccines SAFETY & BENEFITS

Is it safe?

What are the side effects?

Why do young people need to get vaccinated?

Why it's important for young people to get a COVID-19 vaccine

- COVID-19 is no longer a virus that only impacts the elderly. As of July 29, 2021, more than 400 children under 17 have died from COVID-19 in the U.S.
- Young people who get mild cases of COVID-19 are at risk for long-term health issues, such as chronic fatigue, brain fog, respiratory issues, and chest pain.
- Anyone who does not get sick from COVID-19 can still spread the contagious virus to loved ones.
- Youth ages 12–17 are the lowest vaccinated age group in the U.S.
Widespread vaccination can help end the COVID-19 pandemic.

Frequently asked questions about the safety of COVID-19 vaccines

Are the COVID-19 vaccines safe?

Yes. All vaccines authorized by the U.S. Food and Drug Administration (FDA) are **safe and prevent nearly 100% of deaths and hospitalizations due to COVID-19**. Join the 163+ million people in the U.S. who have gotten safely vaccinated today.

What if I have a health condition?

Medical experts at Harvard Medical School recommend people with health conditions to get a COVID-19 vaccine as long as they do not have a severe allergy to an ingredient in the vaccines, which is rare. Please consult your doctor if you have concerns.

Is the vaccine safe for children?

Yes. The Pfizer vaccine is proven to be safe for youth ages 12–17.

The American Academy of Pediatrics and many leading U.S. family physicians strongly urge that **the health risks of being unvaccinated are far greater** than any extremely rare and temporary side effects from the COVID-19 vaccines.
